SurveySphere: Targeted Survey Builder

HTML, CSS, JAVASCRIPT — Case Study No. 27

Academic Year: 2025–2029

1 Problem Statement

Background

Educational institutions routinely need to collect structured feedback from students rating faculty, to organisers gathering post-event responses. The current landscape of survey tools (Google Forms, SurveyMonkey, Typeform) presents several limitations for college-level use:

- Most professional features are behind paid plans.
- No AI integration
- Most tools cannot restrict survey access by age, occupation, or location.

Core Challenge

To build an A.I. powered Survey building platform that has demographic targeting, that can collect and analyse responses, using only HTML, CSS and Javascript.

Key Requirements

01 HTML (Form builder), CSS (Question type icons), JS (Logic branching).

02 Response charts

03 Export options

04 Time-to-complete

05 Demographic-Targeting

2 My Solution

ITM SKILLS UNIVERSITY

⚙️ Architecture

Built entirely with vanilla HTML, CSS, and JavaScript.

🎯 Demographic Targeting

Acts like a barrier, if you don't meet the criteria, you can't fill the survey

💾 Export Options

You can export responses in .csv or .txt file

🤖 Powered by A.I.

A.I. can create forms and can analyse responses

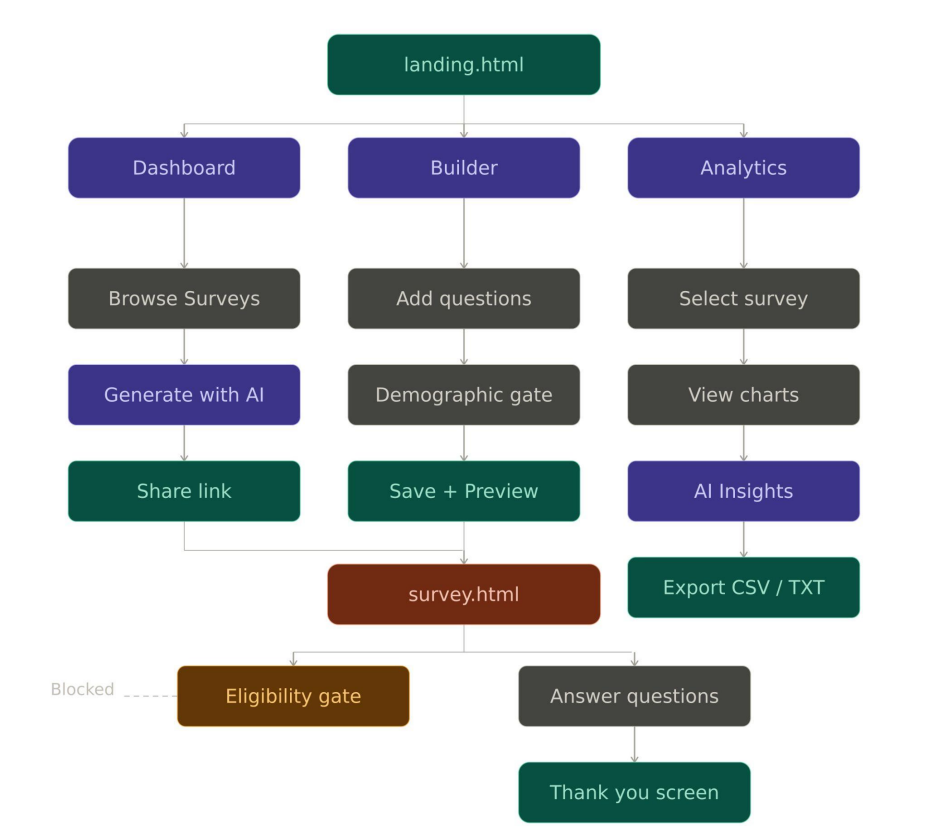
📊 In Depth Analysis

Use of different types of charts like, bar graphs, pie charts, etc

🖥️ User Interface

Very modern and rich aesthetics, whole user workflow is easy to understand

3 Working — Program Flow



4 Conclusion

What Was Achieved

SurveySphere was successfully built and deployed as a fully functional, AI-powered survey platform that runs entirely in the browser with no backend required. The platform integrates Groq's Llama 3.3-70B model for two distinct AI features — generating complete surveys from plain English prompts and analysing response data to produce sentiment scores, key themes, and recommendations.

A smart analytics engine automatically selects the most appropriate chart type per question, and a demographic eligibility gate screens respondents before they access the survey. The app was deployed live on Netlify with GitHub auto-deploy and includes 6 pre-built college survey templates, CSV/TXT export, and per-question time tracking. in professional software design.

Current Limitations

Since all data is stored in the browser's localStorage, share links only work on the same device and browser where the survey was created — making true cross-device sharing impossible without a backend.

Future Scope

- Integrate Firebase or Supabase
- Add Google Sign-In to prevent duplicate responses
- Build a fully mobile-responsive redesign
- Support multiple AI providers
- Enable collaborative survey editing for team-based survey building
- Add email notifications when new responses are received

Thank You
